Dear Hiring Manager,

I'm applying for the Senior Director, Technical Program Management role (R1003100) in San Jose or San Francisco. At SingleStore, a cloud-native database company, I'm Sr Director, Engineering and chief of staff to the CTO, and I lead technical program management and AI enablement.

Capital One builds its own AI, including a generative AI tool that helps employees answer customer questions faster. Getting AI programs from concept to production across many teams, with governance in place, is what I do now:

- Drove SingleStore's internal GenAI adoption through a governance program and internal AI platforms, and lead AI enablement with Claude Code, Amazon Bedrock, and Google Vertex AI.
- Increased engineering velocity 5x through an agile transformation and accountability systems, and run capacity planning and delivery dashboards for engineering leadership.
- Rescued a failing strategic partner integration, which brought in $30M+ in recurring ARR.

I've also built a program function from scratch. At Ripple I grew the delivery team from three project managers to 25, plus 75+ engineers and architects, and delivered 800+ global implementations on the RippleNet payments network. Three people I mentored became CEOs. Ripple's bank network and a $20M+ transformation at Wells Fargo taught me to deliver in regulated environments.

I haven't designed distributed systems myself. Two principal architects report to me; I rely on their depth, ask the right questions, and own the outcome. I also led SingleStore's M&A technical due diligence and integrated the acquired teams. I hold an Executive MBA from Cornell and Queen's and an active PMP.

I'd welcome the chance to talk about your AI platform programs.

Best,

Casey Caster
