Dear Hiring Manager,

I am applying for the Director, Field Engineering role for Emerging Enterprises & Startups (Req ID FEQ327R163). Since 2021 I have run engineering operations at SingleStore, a cloud-native database company, as chief of staff to the CTO, leading through a director, managers, and principal architects.

Databricks grew more than 80% year over year to pass a $7 billion revenue run-rate, and its new Startup Program gives founders up to $200K in credits across Databricks and Neon, plus hands-on technical guidance. Those founders need a field team that scales its coverage through leaders and repeatable mechanisms. That is the work I do:

- Built Ripple's global implementation function, 25 project managers and 75+ engineers and architects, and delivered 800+ global implementations while cutting delivery time from eight months to eight weeks.
- Rescued a failing strategic partner integration at SingleStore through a cross-functional realignment, unlocking $30M+ in recurring ARR.
- Run capacity planning and delivery dashboards, and drove 5x engineering velocity through accountability systems.

I would bring an AI-first operating model to the team. I lead GenAI adoption and governance at SingleStore, use Claude Code, Amazon Bedrock, and Google Vertex AI, and negotiate LLM token pricing with vendors, so I know the cost and governance problems Unity AI Gateway is built to solve. I would use the same tools to build one-to-many coverage for a fast-growing startup segment.

I have not led a pre-sales team. My customer-facing leadership has been in delivery and implementation, where the core of the job is the same: earning trust with executives, guiding complex programs through escalations, and building leaders who raise the bar. I live in Pacifica and work in San Francisco today.

I would welcome the chance to discuss how I can help Databricks scale its startup business. Thank you for your consideration.

Best,

Casey Caster
